write, and execute code to fix this project. 1. Perform a deep recursive scan of the ~/agents/CLIs/ directory. 2. Identify any missing dependencies, broken paths, or structural errors. 3. If you find missing files required to run the dashboard (like app.py, main.py, or required configurations), create them based on the best-fit architecture for a Python web application. 4. Auto-fix any compilation errors, dependency mismatches, or path issues. 5. When the workspace is repaired, initialize the backend services and confirm when the dashboard is live. Work until complete; do not stop to ask for permission.
